Abstract: In this paper we consider a comparative study of different image restoration algorithms. The images are blurred by using both known and unknown degradation functions. The study emphases on restoration of blurred images by using both blind and non-blind restoration techniques like Lucy Richardson Algorithm (LRA), Weiner Filter Deconvolution (WFD), Regularized Filter Deconvolution (RFD) and Blind Image Deconvolution Algorithm (BIDA). Apart from regular images, images from different areas of imaging like medical images and satellite images are considered for this study. Experimental results for the four different image restoration techniques are compared on the basis of performance metrics like PSNR(Peak Signal to Noise Ratio), MSE(Mean Square Error) and RMSE(Root Mean Square Error).

*Keywords:* Image Restoration Algorithm, Lucy Richardson Algorithm, Weiner Filter Deconvolution, Regularized Filter Deconvolution, Blind Image Deconvolution Algorithm, Medical images, Satellite image

### I. INTRODUCTION

Image restoration is the process of recovering back the original image from the degraded image. The original image may be degraded by adding noise, blur or may be due to camera miss-focus. Many medical diseases are predicted upon or even given medication by studying the test results based on images. Also, satellite images are used to gain knowledge of different features on earth such as forest analysis, weather forecasting etc. The analysis of such degraded images will hamper the investigation part and may lead to wrong solutions. Such images have to be restored back to its original form to get the correct results.

Image restoration algorithms can be broadly divided into blind and non-blind techniques where if the degradation function or point spread function (PSF) is known then the algorithm is said to be non-blind whereas if the PSF is unknown then the algorithm is a blind image restoration technique. The goal of this study is to compare and understand such image restoration algorithms for different images that are obtained from various different fields of imaging.

# II. MATERIALS AND METHODOLOGY

## **DATA COLLECTION**

The Landsat Imagery Database was used to acquire satellite images (at 30 m resolution) of different regions of earth by specifying the latitude and longitude coordinates [6]. Each

Colour

one degree of latitude and longitude (approximately 100 km apart). The medical images were collected from the MedicalFinals Database and the MedPix Database [7, 8]. Also, general images divided into black and white and coloured category are also considered for this study. A total of 15 images are considered for each group of images. The medical database group consists of different varieties of images like chest x-rays and CT scan images.

image covers a 10 km by 10 km square at each junction of

Satellite Medical

Black and White

Fig 1: Representative images forBlack and White, Colour, Satellite and Medical Images.

## **Working Principle**

Once the image collection phase is over, the images are degraded using image degradation function. The original images are then tried to be recovered using the image restoration model by applying both blind and non-blind image restoration algorithms.

Fig 2: Image Degradation and Restoration Model

In degradation model, the original image is degraded by using degradation function, also known as point spread function (PSF) and adding noise and can be expressed as

$$g = h * f + n$$

In the above equation, g is the degraded image, h is the degradation function, f is an original image and n is the additive noise.

The restoration model is then applied on the degraded image to get the restored image. The restoration algorithms considered for this study are Lucy Richardson Algorithm (LRA), Weiner Filter Deconvolution (WFD), Regularized Filter Deconvolution (RFD) and Blind Image Deconvolution Algorithm (BIDA).

# 1) Lucy Richardson Algorithm (LRA)

The Lucy–Richardson algorithm(LRA) is a non-blind technique for recovering an image that has been blurred by a known point spread function [1, 2].

Pixels in the observed image can be represented in terms of the point spread function and the image as  $d_i = \sum p_{ij} u_j$ 

where

 $p_{ij}$  is the point spread function,  $u_j$  is the pixel value at location j in the latent image, and  $d_i$  is the observed value at pixel location i. The basic idea is to calculate the most likely  $u_j$  given the observed  $d_i$  and known  $p_{ij}$ . This leads to an equation for  $u_j$  which can be solved iteratively according to

$$u_j^{(t+1)} = u_j^{(t)} \sum_i \frac{d_i}{c_i} p_{ij}$$

$$c_i = \sum_j p_{ij} u_j^{(t)}.$$

where

# 2) Weiner Filter De convolution (WFD)

The Weiner filter de convolution (WFD) is also a nonblind image restoration technique which helps in restoring the original image from the blurred image. Suppose we have a system as:

$$y(t) = h(t) * x(t) + n(t)$$

where \* denotes convolution, x(t) the original image, h(t) the known degradation function, n(t) the added noise and

y(t) the degraded image at time t. The Weiner filter is used to find some g(t) to estimate x(t) as follows:

$$x'(t) = g(t) * y(t)$$

where x'(t) is an estimate of x(t) that minimizes the mean square error.

# 3) Regularized Filter De convolution (RFD)

Regularized filter de convolution (RFD) is a non-blind image restoration algorithm and used to recover the restored image from the degraded image. The blurred and noisy image is restored by a constrained least square restoration algorithm and is similar to the wiener filter. In regularized filtering less prior information is required to apply restoration. The regularization filter is often chosen to be discrete Laplacian and can be understood as an approximation of a Weiner filter [3].

## 4) Blind Image De convolution Algorithm (BIDA)

Blind Image De convolution Algorithm (BIDA) restores the degraded image from the blurred image by using an unknown point spread function. It is a blind technique of image restoration and the first step is to evaluate the blurring factor or PSF value and then it uses this factor to de blur the image. This method can be done both iteratively and non-iteratively [3]. In the non-iterative method the algorithm is executed once and it extracts the PSF value and uses it to restore the original image, whereas in the iterative method, the algorithm iterates more than once and improves the PSF value at each run [4, 5].

### III. IMPLEMENTATION

All the implementation work has been done in MATLAB 7.10. The original images were first degraded by using a degradation function of Gaussian blur having size 5 and standard deviation 5. The degraded images were then restored using the Lucy Richardson Algorithm (LRA), the Weiner Filter Deconvolution (WFD), the Regularized Filter Deconvolution (RFD) and the Blind Image Deconvolution Algorithm (BIDA). The representative images are as follows:

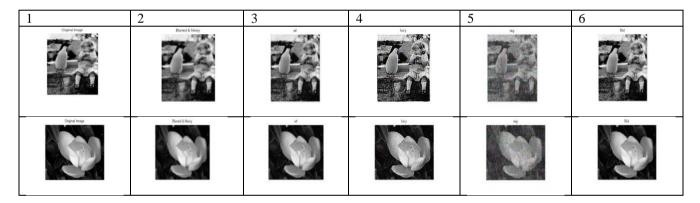

Fig 3: Representative restoration results for black and white images: (1) Original image, (2) Degraded Image using Gaussian blur of size 5 and standard deviation 5, (3) estimated image using Weiner Filter DE convolution, (4)

estimated image using Lucy Richardson Algorithm, (5) estimated image using Regularised Filer De Convolution and (6) estimated image using Blind Image De convolution Algorithm.

## IV. RESULTAND DISCUSSION

This study makes a comparison between the four image restoration algorithms Weiner Filter De convolution (WFD), Lucy Richardson Algorithm (LRA), Blind Image De convolution Algorithm (BIDA) and Regularized Filter De convolution (RFD) on the basis of performance metrics like PSNR(Peak Signal to Noise Ratio), MSE(Mean Square Error) and RMSE( Root Mean Square Error). This comparison is done for all the four groups of images, each group having 15 images representing the different areas of imaging. The results are as followed:

#### A. For Black and White Images:

**Table 1:** Estimation results of all the 15 Black and White images for image restoration algorithms Weiner Filter De convolution (WFD), Lucy Richardson Algorithm (LRA), Blind Image De convolution Algorithm (BIDA) and Regularized Filter De convolution (RFD) on the basis of performance metrics like PSNR(Peak Signal to Noise Ratio), MSE(Mean Square Error) and RMSE(Root Mean Square

Table 1 shows that the Lucy Richardson Algorithm (LRA) has the best values for PSNR, MSE and RMSE for 11 out of 15 images. The Weiner Filter De convolution (WFD) algorithm has the second best values for Black and White images followed by Blind Image De convolution Algorithm (BIDA). The Regularized Filter De convolution (RFD) algorithm has the worst PSNR, MSE and RMSE values for all the images in this category.

Table 4 shows that Regularized Filter De convolution (RFD) algorithm has the best value for PSNR, MSE and RMSE for all images. The Lucy Richardson Algorithm (LRA) has the second best values for Satellite images followed by Blind Image De convolution Algorithm (BIDA). The Weiner Filter De convolution (WFD) algorithm has the worst PSNR, MSE and RMSE values for most of the images in this

# V. CONCLUSION

Image restoration algorithms are used to restore a degraded image back to its original image form. We studied four image restoration algorithms in this study and performed a comparison analysis. Based on this study, it can be said that the Lucy Richardson Algorithm is the best image restoration algorithm to be applied to a degraded image it the image falls under the coloured or black and white category. Whereas, the Regularized Filter De convolution (RFD) algorithm is found to be the best image restoration algorithm when images fall in the medical image or satellite image category.
