# A Tabular Approach for Frequent itemset mining 

G.Krishna Mohan<br>Reader, P.B.Siddhartha College, Vijayawada-10, Andhrapradesh, India km_mm_2000@yahoo.com

#### Abstract

Frequent patterns are patterns that appear in a data set frequently. For example, a set of items, such as milk and bread that appear frequently together in a transaction data set is a frequent itemset. Frequent pattern mining searches for recurring relationships in a given data set. With massive amounts of data continuously being collected and stored, many industries are becoming interested in mining such patterns from their databases. The discovery of interesting correlation relationships among huge amounts of business transaction records can help in many business decision-making processes, such as catalog design, cross-marketing, and customer shopping behavior analysis. If we think of the universe as the set of items available at the store, then each item has a Boolean variable representing the presence or absence of that item. Each basket can then be represented by a Boolean vector of values assigned to these variables. The Boolean vectors can be analyzed for buying patterns that reflect items that are frequently associated or purchased together. A set of items is referred to as an itemset. An itemset that contains k items is a k-itemset. The occurrence frequency of an itemset is the number of transactions that contain the itemset. This is also known, simply, as the frequency, support count, or count of the itemset. The set of frequent $k$-itemsets is commonly denoted by $L_{k}$.

Keywords: Apriori; table; AND operation; database; frequent itemsets

## I. INTRODUCTION

A set of items is referred to as an itemset. An itemset that contains k items is a k-itemset. The occurrence frequency of an itemset is the number of transactions that contain the itemset. This is also known, simply, as the frequency, support count, or count of the itemset. The set of frequent $k$ itemsets is commonly denoted by $\mathrm{L}_{\mathrm{k}}$.

The efficiency of frequent itemset mining algorithms is determined mainly by three factors: the way candidates are generated, the data structure that is used and the implementation details. Most papers focus on the first factor, some describe the underlying data structures, but implementation details are almost always neglected. Indexed Apriori algorithm operates on sorted transactions in the database according to the number of items in the transaction.

## II. LITERATURE REVIEW

Apriori [1] is the most popular algorithm to find all the frequent sets. It is also called the level-wise algorithm. The nicety of the algorithm is that before reading the database at every level, it graciously prunes many of the sets which are unlikely to be frequent sets.

The first pass of the algorithm simply counts item occurrences to determine the frequent itemsets. A subsequent pass, pass $k$, consists of two phases. First, the frequent itemsets $L_{k-1}$ found in the ( $k-1$ )th pass are used to generate the candidate itemsets $\mathrm{C}_{\mathrm{k}}$, using the apriori candidate generation procedure. Next, the database is scanned and the support of candidates in $\mathrm{C}_{\mathrm{k}}$ is counted. For fast counting, we need to efficiently determine the candidates in $\mathrm{C}_{\mathrm{k}}$ contained in a given transaction ' t '. The set of candidate itemsets is ubjected to a pruning process to ensure that all the subsets of the candidate sets are already known to be frequent itemsets. The candidate generation process and the pruning process are the most important parts of this algorithm.

## III. PROPOSED PROCEDURE

The sample database considered to be as shown in the table I. The items involved are \{I1,I2,I3,I4,I5,I6,I7,I8,I9,I10 \} and the minsupport is considered as 3 .

Table I. Sample Database

| Transactions | items |
| :---: | :--- |
| T1 | I3,I4,I6 |
| T2 | I1,I2,I3,I4,I5,I6 |
| T3 | I4,I5,I6,I9 |
| T4 | I4,I6,I8,I10 |
| T5 | I1,I5,I6,I7,I8,I10 |
| T6 | I3,I4,I5,I6,I7,I8,I10 |
| T7 | I1,I3,I5,I7,I9 |
| T8 | I2,I9 |
| T9 | I3,I5,I7,I8,I9,I10 |
| T10 | I1,I4,I9 |

Construct the Initial table as, Items as rows and Transactions as columns. Map the cells in the table with ' 1 ' where the items occurred in a transaction. Calculate all the RCs.

Table II. Initial Table

|  | T1 | T2 | T3 | T4 | T5 | T6 | T7 | $\begin{aligned} & \hline \mathbf{T} \\ & 8 \\ & \hline \end{aligned}$ | $\begin{aligned} & \hline \mathbf{T} \\ & \mathbf{9} \\ & \hline \end{aligned}$ | $\begin{gathered} \hline \mathrm{T} \\ \mathbf{1 0} \\ \hline \end{gathered}$ | R <br> $\mathbf{C}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| I1 |  | 1 |  |  | 1 |  | 1 |  |  | 1 | 4 |
| I2 |  | 1 |  |  |  |  |  | 1 |  |  | 2 |
| I3 | 1 | 1 |  |  |  | 1 | 1 |  | 1 |  | 5 |
| I4 | 1 | 1 | 1 | 1 |  | 1 |  |  |  | 1 | 6 |
| I5 |  | 1 | 1 |  | 1 | 1 | 1 |  | 1 |  | 6 |
| I6 | 1 | 1 | 1 | 1 | 1 | 1 |  |  |  |  | 6 |
| I7 |  |  |  |  | 1 | 1 | 1 |  | 1 |  | 4 |
| 18 |  |  |  | 1 | 1 | 1 |  |  | 1 |  | 4 |

| I9 |  |  | 1 |  |  |  | 1 | 1 | 1 | 1 | 5 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| I10 |  |  |  | 1 | 1 | 1 |  |  | 1 |  | 4 |

SimplifyTab1(D,minsupport):
Check the RCs in the Initial table, if there are any RCs less than minsupport then remove the corresponding items from the table. If there are no items left in the table, which implies there are no frequent item sets.

| $\mathbf{I 1 0}$ | 1 | 1 |
| $\mathbf{C C}$ | 2 |  |

Find -2 :
Generate all item combinations which were left in the simplifiedTab as 2_itemset frequent itemsets for an item.

$$
\mathbf{L}_{2}=\mathbf{N U L L}
$$

## IV. Algorithm

Input: database D, minsupport
Output : All the frequent itemsets in D

1) [Produce the initiaTtable]

SimplifiedTab1 $\leftarrow$ SimplifyTab1(D,minsupport)
If SimplifiedTab1 = NULL
End, No frequent itemsets
Else
[Finding 1_itemset frequent itemsets]
L1 $\leftarrow$ find_1
SimplifiedTab2 $\leftarrow$ SimplifyTab2(SimplifiedTab1,2,minsupport)
2) [Repeat the procedure from first to last with one item in the table]
[start with the initial item in simplifiedTab2 as item]
NewTab $\leftarrow$ GenerateNewTab(SimplifiedTab2, item)
[finding 2_itemset frequent itemsets with item] L2 $\leftarrow$ find_2.
[finding 3_itemset frequent itemsets to maximum column_count frequent itemsets]
While N from 3 to $\operatorname{Max}(\mathrm{CC})$ in the New Tab \{

SimplifiedTab $\leftarrow$ simplifyTab2(NewTab ,N, minsupport)
if (SimplifiedTab != NULL )

While (Any column count $=\mathrm{N}$ )
$\mathrm{L}_{\mathrm{N}} \leftarrow$ find_N [collection of exact $\mathrm{N}_{\text {_item }}$
frequent itemsets in the New Tab ]
SimplifiedTab $\leftarrow$ Remove (SimplifiedTab ,Transaction)
SimplifiedTab $\leftarrow$ SimplifyTab2(SimplifiedTab ,N, minsupport )
if (SimplifiedTab != NULL )
[find out all other $N$ frequent itemsets ]
[Find out all the possible $N$ item combinations from
New Tab items starting with item]
$\mathrm{L}_{\mathrm{N}} \leftarrow$ find_N. [collection of all N_frequent
itemsets in the New Tab] Increment N
NewTab=SimplifiedTab.
End while
\}
Take next item in the table as item and continue the above procedure
End procedure
3) [ find out all frequent item sets ]

Answers $\leftarrow \mathrm{L}_{1} \mathrm{UL}_{2} \mathrm{U} \mathrm{L}_{3} \mathrm{UL}_{4}$------- $\mathrm{U} \mathrm{L}_{\text {maxitem. }}$
4) [END]

## V. Results

The Frequent itemsets that were generated on the sample database with a minimum support of 3 are $L_{1} \mathrm{U}_{2} \mathrm{U} \mathrm{L}_{3} \mathrm{U}$ $\mathrm{L}_{4}$
Where,
$\mathrm{L}_{1}=\{\mathrm{I} 1\},\{\mathrm{I} 3\},\{\mathrm{I} 4\},\{\mathrm{I} 5\},\{\mathrm{I} 6\},\{\mathrm{I} 7\},\{\mathrm{I} 8\},\{\mathrm{I} 9\}$.
$\mathrm{L}_{2}=\{\mathrm{I} 1, \mathrm{I} 5\},\{\mathrm{I} 3, \mathrm{I} 4\},\{\mathrm{I} 3, \mathrm{I} 5\},\{\mathrm{I} 3, \mathrm{I} 6\},\{\mathrm{I} 3, \mathrm{I} 7\}$,
\{I4,I5\},\{I4,I6\}, \{I5,I6\},\{I5,I7\},\{I5,I8\},\{I5,I9\},\{I5,I10\}, \{I6,I8\},\{I6,I10\},\{I7,I8\},\{I7,I10\},\{I8,I10\}.
$\mathrm{L}_{3}=\{\mathrm{I} 3, \mathrm{II}, \mathrm{I} 6\},\{\mathrm{I} 3, \mathrm{I}, \mathrm{I} 7\},\{\mathrm{I} 4, \mathrm{I} 5, \mathrm{I} 6\},\{\mathrm{I} 5, \mathrm{I} 7, \mathrm{I} 8\},\{\mathrm{I} 5, \mathrm{I} 7, \mathrm{I} 10\}$, $\{\mathrm{I}, \mathrm{I} 8, \mathrm{I} 10\},\{\mathrm{I} 6, \mathrm{I} 8, \mathrm{I} 10\},\{\mathrm{I} 7, \mathrm{I}, \mathrm{I} 10\}$.
$\mathrm{L}_{4}=\{\mathrm{I}, \mathrm{I} 7, \mathrm{I} 8, \mathrm{I} 10\}$.

## VI. CONCLUSION

The performance of the proposed algorithm on some of the sample databases which contain the number of transactions as $20,40,60,80,100$ is shown in the following graph in terms of CPU execution time.

Figure 1. performance of the proposed algorithm
